

**IN THE CLAIMS**

1. (previously presented) An information processing editing apparatus for allowing an editor to create final superimposed scenes from content information according to a predetermined specification, comprising:

a shared-scene creation module operable allow the editor to define shared scenes that are superimposable to create a single, superimposed final scene, the shared scenes being virtual scenes formed in accordance with an internal format and used to form the final scenes, each of the shared scenes comprising one or more shared objects that are controllable for display to create final scenes, the shared objects being separately controllable independent of the defined shared scenes in which the shared objects are displayed in accordance with the predetermined specification;

a shared-scene processing module operable to enable the editor to virtually superimpose two or more shared scenes, each of the shared scenes comprising one or more of the shared objects, for creating the superimposed final superimposed scenes with the shared objects from each selected shared scene;

an application creation module operable to describe control information in accordance with the internal format based on the shared scenes set by the editor via said shared-scenes creation and processing modules; and

an output control module for converting the control information into shared object control information for forming the final superimposed scenes in which the shared objects selected by combining shared scenes are specified for display at the same time in the final superimposed scenes in accordance with the predetermined specification;

wherein the superimposed final scenes are described by the combination of one or more shared scenes and one or more of the shared objects based on the internal format, and the converted

control information is described based on one or more of the shared objects without the shared scenes.

2. (previously presented) An information processing editing apparatus according to claim 1, wherein said shared-scene processing module further specifies an order of superposition of a plurality of said shared scenes; and

said application creation module further describes said control information for controlling an order of superposition of said shared objects used for each of the final superimposed scenes as a state of utilization of shared objects in each of the final superimposed scenes in accordance with said order of superposition of said shared scenes.

3. (cancelled)

4. (cancelled)

5. (previously presented) A method according to claim 9, further comprising controlling utilization of the at least one shared object in each of the final superimposed scenes based upon the predetermined specification and the shared scenes.

6. (previously presented) A method according to claim 5, further comprising:

specifying an order of superposition of the shared scenes; and

describing the control information to control an order of superposition of the shared objects based upon the order of superposition of the shared scenes.

7. (previously presented) An information editing processing apparatus for allowing an editor to create final

superimposed scenes from content information according to a predetermined specification comprising:

shared-scene creation means for allowing the editor to define shared scenes that are superimposable to create a single, superimposed final scene, the shared scenes being virtual scenes formed in accordance with an internal format and used to form the final superimposed scenes, each of the shared scenes comprising one or more shared objects that are controllable for display to create final superimposed scenes, the shared objects being separately controllable independent of the defined shared scenes in which the shared objects are displayed in accordance with said predetermined specification;

shared-scene processing means for enabling the editor to virtually superimpose two or more shared scenes, each of the shared scenes comprising one or more of the shared objects, for creating the superimposed final superimposed scenes with the shared objects from each selected shared scene;

control-information description means for describing control information in accordance with the internal format based on the shared scenes set by the editor; and

converting means for converting the control information into shared object control information for forming the final superimposed scenes in which the shared objects selected by combining shared scenes are specified for display at the same time in the final superimposed scenes created in accordance with the predetermined specification;

wherein the superimposed final scenes are described by the combination of one or more shared scenes and one or more of the shared objects based on the internal format, and the converted control information is described based on one or more of the shared objects without the shared scenes.

8. (previously presented) An information processing editing apparatus for allowing an editor to create final superimposed scenes from broadcast content information according to a predetermined data broadcasting specification comprising:

shared-scene creation means for allowing the editor to define shared scenes that are superimposable to create a single, superimposed final scene, the shared scenes being virtual scenes formed in accordance with an internal format and used to form the final superimposed scenes, each of the shared scenes comprising one or more shared objects that are controllable for display to create final superimposed scenes, the shared objects being separately controllable independent of the defined shared scenes in which the shared objects are displayed in accordance with the data broadcasting specification;

shared-scene processing means for enabling the editor to virtually superimpose two or more shared scenes, each of the shared scenes comprising one or more of the shared objects, for creating the superimposed final superimposed scenes with the shared objects from each selected shared scene;

control-information description means for describing control information in accordance with the internal format based on the shared scenes set by the editor; and

converting means for converting the control information into shared object control information for forming the final superimposed scenes in which the shared objects selected by combining shared scenes are specified for display at the same time in the final superimposed scenes in accordance with the data broadcasting specification;

wherein the superimposed final scenes are described by the combination of one or more shared scenes and one or more of the shared objects based on the internal format, and the converted control information is described based on one or more of the shared objects without the shared scenes.

9. (previously presented) A computer-implemented method for allowing an editor to create final superimposed scenes from shared scenes from content information according to a predetermined specification, comprising:

defining shared scenes that are superimposable to create a single, superimposed final scene, the shared scenes being virtual scenes formed in accordance with an internal format and used to form the final superimposed scenes, each of the shared scenes including at least one shared object controllable for display to create final superimposed scenes, the shared objects being separately controllable independent of the defined shared scenes in which the shared objects are displayed in accordance with the predetermined specification;

virtually superimposing two or more shared scenes, each of the shared scenes comprising one or more of the shared objects, for creating the superimposed final superimposed scenes with the shared objects from each selected shared scene;

describing control information in accordance with the internal format based on the shared scenes;

converting the control information into shared object control information for forming the final superimposed scenes in which the shared objects selected by combining shared scenes are specified for display at the same time in the final superimposed scenes in accordance with the predetermined specification;

describing the superimposed final scenes by the combination of one or more shared scenes and one or more of the shared objects based on the internal format; and

describing the converted control information based on one or more of the shared objects without the shared scenes.

10. (previously presented) A computer-implemented method for allowing an editor to create final superimposed scenes from

shared scenes from content information according to a data broadcasting specification, comprising:

defining shared scenes that are superimposable to create a single, superimposed final scene, the shared scenes being virtual scenes formed in accordance with an internal format and used to form the final superimposed scenes, each of the shared scenes including at least one shared object controllable for display to create final superimposed scenes, the shared objects being separately controllable independent of the defined shared scenes in which the shared objects are displayed in accordance with the data broadcasting specification;

virtually superimposing two or more shared scenes, each of the shared scenes comprising one or more of the shared objects, for creating the superimposed final superimposed scenes with the shared objects from each selected shared scene;

describing control information in accordance with the internal format based on the shared scenes;

converting the control information into shared object control information for forming the final superimposed scenes in which the shared objects selected by combining shared scenes are specified for display at the same time in the final superimposed scene in accordance with the data broadcasting specification;

describing the superimposed final scenes by the combination of one or more shared scenes and one or more of the shared objects based on the internal format; and

describing the converted control information based on one or more of the shared objects without the shared scenes.

11. (previously presented) A memory device for storing instructions for operating a computer to allow an editor to create final superimposed scenes from shared scenes from content information according to a predetermined specification, the instructions comprising instructions for:

defining shared scenes that are superimposable to create a single, superimposed final scene, the shared scenes being virtual scenes formed in accordance with an internal format and used to form the final superimposed scenes, each of the shared scenes including at least one shared object controllable for display to create final superimposed scenes, the shared objects being separately controllable independent of the defined shared scenes in which the shared objects are displayed in accordance with the predetermined specification;

virtually superimposing two or more shared scenes, each of the shared scenes comprising one or more of the shared objects, for creating the superimposed final superimposed scenes with the shared objects from each selected shared scene;

describing control information in accordance with the internal format based on the shared scenes;

converting the control information into shared object control information for forming the final superimposed scenes in which the shared objects selected by combining shared scenes are specified for display at the same time in the final superimposed scenes in accordance with the predetermined specification;

describing the superimposed final scenes by the combination of one or more shared scenes and one or more of the shared objects based on the internal format; and

describing the converted control information based on one or more of the shared objects without the shared scenes.

12. (previously presented) An information editing processing apparatus for allowing an editor to create final superimposed scenes from intermediate scene templates comprising:

a shared-scene creation module operable to allow the editor to define intermediate scene templates that are superimposable to create a single, superimposed final scene in accordance with

an internal format that include one or more shared objects that are controllable in an always on or always off manner for display to create final superimposed scenes, the shared objects being separately controllable independent of the defined shared scenes in which the shared objects are displayed in accordance with a predetermined, industry-standard specification;

a shared-scene processing module operable to enable the editor to virtually superimpose two or more of the intermediate scene templates to form a desired final superimposed scene that is a superposition of the shared objects contained within the editor-selected intermediate scene templates;

an application creation module operable to form shared-scene definition statements of shared objects files in accordance with the internal format, the shared object files comprising shared objects from the combined editor-selected intermediate scene templates;

an output control module for providing description files that include descriptions of links for controlling the shared objects from the shared object files from each editor-selected intermediate scene template, the description files forming a script that complies with the industry-standard specification to display the shared objects at the same time in the final superimposed scenes;

wherein the superimposed final scene is described by the combination of one or more scene templates and one or more of the shared objects based on the internal format, and the converted control information is described based on one or more of the shared objects without the shared scenes.
